

Notification Rules V2 Requirements

The complexity of configuring and managing notifications workflows, particularly for organizations supporting multiple brands or use-cases, slows down customer onboarding and limits Flyreel's ability to give customers both control over and visibility into their own notification configurations.

For improved platform continuity and functionality, use design and feature updates introduced via the Insight Configurations page as a base to restructure and enhance the Notification Rules, creating a dynamic, intuitive tool to create, visualize, organize, and edit notification configurations.

The ultimate goal is to provide user role-based carrier visibility into and control over notification rules.

Milestone 1: Main Page of Notification Rules V2

- Set up Notification V2 infrastructure and UI, allowing it to be simultaneously supported alongside V1 and introducing critical back end validation rules.
- Create new notification-configs collection and associated POST, PATCH, GET, DELETE endpoints
- Implement a dedicated Notification Configurations Dropdown in the Configuration Menu
- Main view and rules for “Notification Configurations” page, including active and inactive config tabs and expandable rule details section, allowing role based access to either view-only or edit-enabled config settings.

Milestone 2: Create / Edit notification rules

- Creating and editing notification configurations
- Updated datapoint and operator list
- Reintroduce the Notification Type field
- Improved handling of recurring message anchor dates
- Introduce soft delete functionality

Milestone 3: Notification Configurations Enhancement

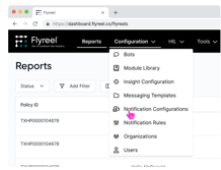

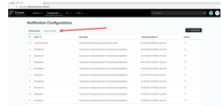

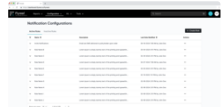

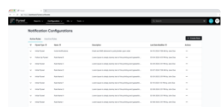

- Add unopened emails datapoint
- Pull Notification config information into Metabase to be used for analytics
- Add help page accessible from Notification Configuration main page, view page, and edit page.
- API documentation updates

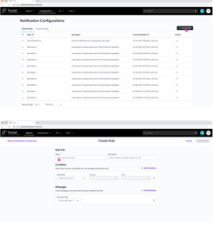

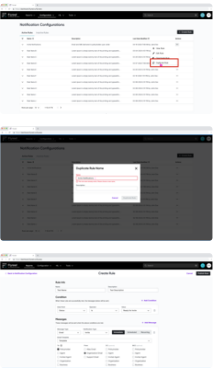

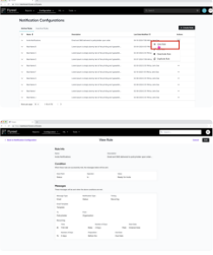

Future Work: Notification Configuration Enhanced Main Page

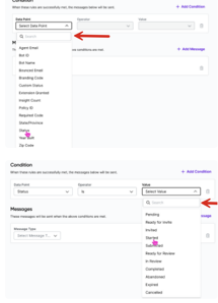

- Introduce notification rule grouping functionality
- Introduce filtering for the rules main page
- Surface change log to users in UI

Requirements

Requirement	Details	User Story	Design Notes	Additional Notes	Milestone
Support both V1 and V2 Notification Rule Configurations	Notification Rules V2 will eventually replace Notification Rules V1; however, until both Notification Rules V2 and Insight Configurations launch, Notifications Rules V1 cannot be deprecated. New endpoints and tables will need to be created to handle the operations and data related to Notification Workflow Configurations.	As a Developer, I want to define the technical architecture to support Notification Rules V2 without impacting Notification Rules V1 tables, So that we can continue to support both services simultaneously.		Validation must be in place for 1. Org Settings Check 2. Send config check 3. Toggles (email, SMS, Push, Webhook) 4. 4 Email aliasing 5. Agent access 6. RL/FUF 7. Extensions 8. Custom fields 9. Statuses 10. Etc There must be parity between the rules that can be configured via the API and the front end.	Milestone 1: Standup Notification Rules V2
Notification Rule Configurations main page					

Navigating to Notification Configuration	Add “Notification Configuration” to the “configurations” tab of the Dashboard’s main navigation menu.	As a Dashboard User, I want to access Notification Configurations page from the Configurations tab of the main navigation menu So that I can easily find and view my organizations workflows.		We have to be able to support both V1 and V2 of notification rules at the same time, until all customers are fully migrated to notification rules v2 and insight configurations.	Milestone 1: Standup Notification Rules V2
Active and Inactive Rules Tabs	Introduce a “soft delete” functionality where users can inactivate rules, without Fully deleting them. Inactive rules should be separated out into their own tab, which mirrors the format of the main Active rules tab.			If rules are moved from the inactive state back to active, we need to un validation on them to make sure the name is still unique and the fields/values are all still valid. If not, we need to throw an error message calling out the conflict and the user needs to update before reactivating.	
Notification Configurations Page Organization	The page displays each notification rule configured for the organization and follows the design scheme of Insight Configuration. If follow up flyreels are not enabled for an organization: Main page table columns: 1. Name 2. Description 3. Date Last Modified 4. Actions Workflow list can be sorted on columns 1 and 3. If follow up flyreels are enabled for an organization: Main page table columns: 1. Flyreel Type 2. Name 3. Description 4. Date Last Modified 5. Actions Workflow list can be sorted on columns 1, 2, and 4. **The description column has limited space. If the description is long, users should be able to view the complete text by hovering over the description and seeing a box appear with the full description.	As a Dashboard User, I want to view all notification rules on a single page, So that I can easily manage and monitor them.	Initial Flyreels only enabled  Initial and Follow Up Flyreels enabled  Long rule descriptions 	Flyreel Type is a new field which will dynamically appear/be a required field when creating/editing a rule, and is explained in the section below.	Milestone 1: Standup Notification Rules V2
Expandable Rule Details Section	Expanding a rule’s details displays condition details and message details, similar to Insight Configurations.	As a Dashboard User,		Condition Summary Columns Data Point Operator Value	Milestone 1: Standup

	From the main page, you can expand/collapse individual rules, as well as expand/collapse all.	I want to be able to quick-view key rule details, So that I can easily access a summary of configurations and identify the correct rule for further action without navigating between pages.		Message summary columns Message Type Notification Type Timing Template	Notification Rules V2
Notification Rule Action Options	Users can perform the following actions on each rule from the Notification Configuration page: 1. Expand details (left side chevron) 2. View 3. Edit 4. Duplicate 5. Active/inactive	As a Dashboard User, I want to perform actions on notification rules, So that I can manage them effectively.		Only inactivated rules should have the options to fully delete.	Milestone 1: Standup Notification Rules V2
Creating a new Notification Rule	Selecting "Create New Rule" from the main Notification Configuration page launches the rule config page.	As a System Administrator, I want to efficiently create net new rules, So that I am able to directly manage my organization's notification configurations.			Milestone 1: Standup Notification Rules V2
Duplicating a Rule	Selecting Duplicate from the action section will kick off a new flow, similar to creating a net new rule, where the user will be prompted to rename the rule and add a new description, then will see the create rule page with the original rule's logic pre-populated. Users can make the necessary changes from there.	As a System Admin, I want to duplicate an existing rule, So that I can save time creating new rules with similar logic to existing rules.			Milestone 1: Standup Notification Rules V2
Viewing an Existing Rule	Selecting View from the action section will open a view only page, which lists all rule configs without providing the option to edit any fields. In future state, we can also modify user permission for greater flexibility. Non-admins can access view only pages in notification configurations, providing visibility into but not control over, configs.	As a System Administrator, I want to view existing rules without entering edit mode, So that I am able to view all configuration details without risking accidental changes.			Milestone 1: Standup Notification Rules V2

Notification Rule Create/Edit page					
Notification Rule Configuration page	Update the existing notification created/edit rule page to match Insight Configuration design scheme, adding the following new fields: - Notification Type - Flyreel Type (only if more than Initial Flyreels are enabled for the organization). - Updated fields for Recurring messages	As a System Administrator, I want to have an intuitive tool to view and edit notification rules, So that I can better understand the sequence of and triggers for end-user messages.	Initial Flyreels only  Initial and Follow Up Flyreels enabled 		Milestone 1: Standup Notification Rules V2
Flyreel Type Field	Add Flyreel Type as a single-select field to the top of the notification configuration page, alongside Name and Description – only appearing for organizations that have more than the initial flyreel enabled. This field should map to the <code>eventSources</code> BE field and have two options: Initial Flyreel and Follow Up Flyreel. This field should also be reflected in the main notification configuration table view page, as a dynamic column to the left of Name – only appearing for organizations that have more than the initial flyreel enabled.	As a Flyreel Engineer, I want to have users select the Flyreel Type from a single-select field, So that our system knows which rules to apply to which Flyreels.	This is a dropdown menu with two options: - Initial Flyreel - Follow Up Flyreel	Flyreel Type is a backend tag on existing notification rules, mapping to <code>eventSources</code>. It indicates what event sources the notification rule applies to.  While we only have initial flyreels right now, we are adding follow up flyreels and could add more event sources other than flyreels in the future, such as recommendation letters etc. In current state, it only exists in the backend, but in the new notification rules, it will be pulled into the front end as well and show up for orgs that have more than just initial flyreels enabled.	Milestone 1: Standup Notification Rules V2
Data Point and Value Smart Search	Enable Data Point and Value smart search	As a System Administrator, I want to easily search the Data Point and Value menus, So that I do not need to scroll through a long list each time I add a new condition.	As used by Insight Configs 		Milestone 1: Standup Notification Rules V2

Enhanced
Control of
Recurring
Messages

Recurring messages can be stopped x
amount of days before or after anchor dates

^^ Look at how this is handled for scheduled
messages for guidance

As a System
Administrator,

I want to create
end-dates for
recurring
messages that are
relative to a
selection of
anchor dates,

So that I can
easily adapt the
workflow to
variations in
launch cycle,
without
accidentally
causing
notifications to
overlap.

Recurring config options

Time

- 24 options, on the hour, with numerical time and meridiem merged.
- 12:00 AM - 11:00 PM

Milestone 1:
Standup
Notification
Rules V2

				merged. • 12:00 AM - 11:00 PM	
Message sender / receiver options	Email sender receiver options: <i>To/BCC/CC</i> 1. Policyholder 2. Organization 3. Agent (only if agent access is not enabled for the organization) 4. Invited Agent (only if agent access is configured for the org AND notification type is not set to Invite) 5. Business (only if there are commercial bots configured for the org) 6. Additional Emails (only for email messages) <i>From</i> 1. Alias (only if email aliasing is configured for the org) 2. Organization 3. Support For SMS, and Push Notifications, this field is read only. • SMS: Policyholder • Push: Policyholder For Webhook, this field is replaced by the Webhook URL field.	As a System Admin, I want to select from a list of dynamic sender/receiver types based on the message type and my organization's configurations, So that I can quickly and more accurately configure messages.	Email:  SMS:  Push:  Webhook: 	We want underwriter email, but we don't currently have an efficient way to associate flyreels with assigned underwriters. Once we do, we will add that as a recipient email address. In current state, organizations can add underwriter email as a custom field and then put the custom field place holder in. Agent email and invited agent email dynamically switch, depending on if agent access is enabled for the organization. If notification type is set to Invite and the org as agent access enabled, Invited Agent should be greyed out/not clickable for <i>To/BCC/CC</i>. You can't add the invited agent email until after the Flyreel has been created since the email needs to be validated.	Milestone 1: Standup Notification Rules V2
Additional Emails Dropdown Menu	Deprecate the current free text field for "Additional Emails" and replace it with a dynamic dropdown interface. The new interface will feature a "+" button that allows users to add multiple additional email recipients. Each added entry will be selected from a dropdown menu populated only with custom fields of type <code>Email</code>. This ensures consistency, prevents manual entry errors, and enforces valid email source selection based on predefined custom fields. Edit Feb 10, 2026: There also needs to be an "Other" option in the dropdown menu for a free text field that allows users to put in email addresses that are currently hard coded in notification rules. Slack	As a user configuring notification rules, I want to select additional email recipients from a dropdown of predefined email-type custom fields So that I can avoid typing errors, eliminate the need for placeholders, and ensure that all additional emails come from valid, structured data fields.			
Add Type selector and delete functionality to custom field configurations	Enhance the Custom Field Configuration UI by adding a required "Type" selector that allows users to explicitly define the data type for each custom field. While the current UI displays the type as "text" by default, users currently have no way to configure it. The new selector should include the following type options:	As an admin configuring custom fields, I want to be able to set a required data type (Text, Email, or Phone			

	• Text • Email • Phone Number This type must be selected during custom field creation or editing and should enforce data validation rules upon flyreel creation, based on the selected type. All existing custom fields in the system should be updated to include a valid type—defaulting to Text where appropriate if a specific type cannot be inferred. Additionally, there is currently no way to delete custom fields once they are created. We need to add that to support changing field requirements.	Number) for each custom field			
Enhanced Readability of Email message Sender and Recipient Section	Add a hover over info icon next to the “To” sender header to improve section usability. For emails, the information text should be as follows: Policyholder: The policyholder email provided at the time of Flyreel creation. Organization: The organization email is the inbox configured in your organizational settings. It typically follows a patter similar to [Organization Name]@flyreel.co. Agent: The agent email provided at the time of Flyreel creation. Please note, these notifications will not send if the Agent Email field is not populated at the time of Flyreel creation. Invited Agent: The agent email included when a report is shared via agent access. Business: For commercial Flyreels, the business email provided at the time of Flyreel creation. Additional Emails: This field accepts <i>only</i> custom fields of type Email, which are configured at the organizational level. Invited Agent and Business should only be included if the organization has the relevant organization configs/bots enabled. No info icon/text is needed on Webhook, SMS, or push notification messages, since those are all read only.	As a System Admin, I want to see a hover-over info icons next to the “To” sender header in the email message section, So that I can understand the purpose of each sender type.			Milestone 1: Standup Notification Rules V2

Notification Type Field	Notification Type is reintroduced to the Create/Edit Rule window as a required field: • Invite • Reminder • Deadline Approaching • Extension Available • Extension Granted • Deadline Passed • Completed • Organization Update (only for emails and webhooks) **Webhook messages can only be notification type Organization Update **SMS and Push notifications cannot be of the notification type Organization Update, since those go only to users This field need to be pulled into Metabase for analytics.	As a System Administrator, I want to know what type of messages are being sent by each rule, So that the rule summaries are easier to understand at a glance. As a Flyreel Administrator, I want to know the type of each notification, So that we have an easy tag to use during analytics.	Email:  SMS:  Push:  Webhooks: 	Tooltip Language These labels are used for analytics purposes and do not autofill configurations.	Milestone 1: Standup Notification Rules V2
Webhook Version Toggle	For webhooks, update V2/V3 dropdown to be a toggle, similar to the immediate/scheduled/recurring toggle for other message types.  Add a hover over information icon to assist users. The information text should be as follows: Select the Flyreel API version used by your organization. If you are unsure, please contact your Flyreel Account Manager for assistance.	As Jeff Soffer, I want a V2/V3 toggle for webhook version, ...because I think the dropdown menu is less intuitive and an eyesore.		Ideally, this should be set in organizational configurations, since organization use <i>either</i> the v2 or v3 api, not both. The request was to keep this in notification configuration for now, but we have added a hover over information icon to assist users.	Milestone 1: Standup Notification Rules V2
Required and Optional Fields	All fields are required, with the exception of email CC and BCC, which have “Optional” beside them to differentiate. All rule names need to be unique. If required fields are not populated, the Publish Rule button will stay inactive.	As a System Admin, I want to know what is not required when creating or editing a notification rule, So that I can successfully publish the rule.	Error if Rule Name is already used  Optional next to CC and BCC  Inactive Publish Rule 		

			 Active Publish Rule Notification for users if they try to publish a rule without fully populating required fields ** This should actually read: Publishing is disabled until all required fields are completed.		
Tracking Rule Config Changes	All edits made to rule configs need to be easily traceable in the back end. Anytime a rule is created, updated, activated, or deactivated, the change/user/timestamp needs to be logged.	As an Internal Super Admin, I want to be able to query notification config changes, So that I can track the Rule's lifecycle and when/by who changes were made and provide clarity to carriers, if they have questions.	Not in UI, only in backend for now.	We did not account for this in the original designs, so we will not surface a rule change log in the UI as part of this work. If we find users want a change log in the UI, we will investigate that for future work.	Milestone 1: Standup Notification Rules V2
Condition Data Point, Operator, and Value Updates					
For full table of changes, SEE HERE .					
Condition Logic Dynamically Pulled by API	Datapoints, operators, and values should always be aligned in the front and back end. Hardcoding in the UI leads to errors when the backend is updated. These fields should pull directly from what is configured in the back end.	As a QA Engineer, I want to ensure parity between front and back end configurations, So that the system functions correctly and users experience consistent behavior across the application			Milestone 1: Standup Notification Rules V2
No Emails Opened to Date	Add Data Point: No Emails Opened to Date Operators:	As a System Administrator, I want to trigger additional		For full table of changes, SEE HERE. Technical feasibility check	Milestone 2: Notification Configurations Enhancement

	• Is Values: • True • False Paired with a status condition of less than started, this can be used to alert agents that they may need to reach out directly to policy holders or to attempt a different form of outreach, such as SMS.	notifications to policyholders and/or agents when all previous attempts to reach the policyholder have failed, So that we can ensure important communications are delivered and necessary actions are taken promptly.		• not concerned about feasibility, but concerned about reliability, as tracking email opening is not	
Targeted Data Point List	Remove Data Points: 1. Detections 2. Answer Locations 3. Agent Name 4. Agent Phone 5. Roof Wet Ponding 6. Roof Dry Ponding 7. Roof Staining 8. Roof Streaking 9. Roof Debris 10. Recall 11. Dishwasher Age 12. Refrigerator Age 13. Washing Machine Age 14. All bot based message keys These Data Points either support insight logic instead of notification logic or are too specific (agent name and phone number) We do not currently send notifications to policy holders based on inspections outcomes, like the detection of a recall or roof issues, so these type of Data Points will only confused admins during configuration. That said, it could be interesting to explore configurable notifications based on recalls in the future.	As a System Administrator, I want to only have condition Data Point options that support notification logic, So that notification configuration is less confusing and more efficient.		For full table of changes, SEE HERE. We need to understand if Agent Name should actually be updated to Agency Name, as some carriers use it differently. Agency name could be relevant to notification rules.	Milestone 1: Standup Notification Rules V2
Revised Data Point Config Options	Update Data Point operators/values: Zip Code: • Remove operator: ◦ Greater than Bot Name: • Remove operator: ◦ Greater than • Org Bot names should show up in a selectable list for multi-select operators and a dropdown for single select Bot ID: • Remove operator: ◦ Greater than	As a System Administrator, I want to be presented with operator and value options that make sense with their Data Points, So that notification configuration is more intuitive and avoids errors.		For full table of changes, SEE HERE.	Milestone 1: Standup Notification Rules V2

	• Org Bot IDs should show up in a selectable list for multi-select operators and a dropdown for single select Bounced Email: • Remove operators: ◦ Is one of ◦ Is not one of Policy ID: • Update operators ◦ Contains ◦ Does not contain ◦ Contains any of ◦ Does not contain any of Agent Email • Update operators ◦ Is ◦ Is not ◦ Contains ◦ Does not contain • Update Values ◦ For is / is not operators, the only value should be “present”. ◦ For contains / does not contain, the value should be a free text box that starts with @. Year Built: • Add operator ◦ Less than • Update value format ◦ Drop down menus for single select ◦ Check boxes dows multi-select Extension Granted: • Remove from operators: ◦ Is not ◦ Is one of ◦ Is not one of Insight Count: • Remove from operators ◦ Is ◦ Is not ◦ Is one of ◦ Is not one of ◦ Greater than or equal to				
User Role Permissions					
Admin Role Editor Permissions	User role permissions updated to allow System Administrators to view, edit, create, toggle active/inactive, and delete notification rules.	As a System Administrator, I want to have editing permissions for notification rules, So that I can directly manage	N/A		TBD

		my organization's notification configurations.			
Inspection Analyst Role View-Only Permissions	User role permissions updated to include view-only permission for Inspection Analysts. View only permissions allow users to expand notification details and to open the full rule configuration page, but not create, edit, toggle active/inactive, or delete notification rules.	As an Inspection Analyst, I want to have viewing permissions for workflows, So that I can understand the end-user experience, without being a System Administrator.	N/A		<i>TBD</i>
Pre-Launch Activities					
Migrate Existing Notification Rules from V1 to V2	Customers currently have all their messaged triggered by Notification Rules, which includes the configurations for insights. Insights will need to be migrated to Insight Configurations, as well.	As a Customer, I want to have my organization's Notification Rules automatically migrated to V2 without interruption to service, So that I can ensure the highest quality of service to my policyholders.		This can only happen once insight configuration work completes	<i>TBD</i>
Notification Rules Analytics	In Metabase, users should be able to run analytics based on templates, notification types (invite, reminder, status, etc), and message type (email, SMS, push, webhook).	As a Metabase User, I want to have the ability to gauge impact of notifications on order outcomes, such as completion rate, So that I can compile quantitative evidence to support customer best practice recommendations.			Milestone 2: Notification Configurations Enhancement
Update User Documentation	A new Dashboard User Guide is currently being put together. Before this feature launches to production, a new section will have to be added to the user guide, since it will be customer facing. The view-only access instructions should be included in the Dashboard User Guide.	As a Dashboard User, I want to have a clear and concise Notification Rule Configurations user guide,			Milestone 2: Notification Configurations Enhancement

		So that I am able to independently learn how to locate, view, and edit Notification Rules.			
Update User UI Configuration Documentation	A separate configuration guide should be created for both internal Super Admins and external System Admins. A link to this guide should be available directly in the Notification Configurations main page, view page, and edit pages.	As a Dashboard Administrator, I want to have a clear and concise Notification Workflow Builder UI configuration guide, So that I am able to independently learn how to configure workflows and employ best practices.		Additional update will be required when grouping is introduced.	Milestone 2: Notification Configurations Enhancement
Update API Documentation	Work with the technical writing team to get API guides updated to include new Notification Rule information.	As a Customer Developer, I want to have a clear and concise Notification Rule API configuration guide, So that I am able to independently learn how to configure rules and employ best practices.			Milestone 2: Notification Configurations Enhancement
Train Customer Facing Staff	Conduct training with CSMs and support staff on Notification Rules V2 so they can support customers when they get access to both view-only and editor Notification Rule Configurations.	As a Support Agent and/or CSM, I want to be trained on Notification Rule Configurations, So that I am able to efficiently support customers when they reach out with questions.			Milestone 2: Notification Configurations Enhancement
